This article introduces a special issue of *Software Process – Improvement and Practice* focusing on processes found in free or open source software development (F/OSSD) projects. It seeks to provide a background review of research in this area through a review of selected empirical studies of F/OSSD processes. The results and findings from a survey of empirical studies of F/OSSD give rise to an interesting variety of opportunities and challenges for understanding these processes, which are identified along the way. Overall, what becomes clear is that studies of F/OSSD processes reveal a more diverse set of different types of processes than have typically been examined in conventional software development projects. The articles in this special issue further advance understanding of what processes characterize and shape F/OSSD. Copyright © 2006 John Wiley & Sons, Ltd.

KEY WORDS: open source software development; free software development; free/open source software processes

1. INTRODUCTION

This article explores patterns and processes that emerge in free/open source software development (F/OSSD) projects. F/OSSD is a relatively new way of building and deploying large software systems on a global basis, and differs in many interesting ways from the principles and practices traditionally advocated for software engineering (SE) (Feller *et al.*

2005). Hundreds of F/OSS systems are now in widespread use by thousands, or in some cases, millions of end-users. And some of these F/OSS systems (e.g. Mozilla Web browser, OpenOffice productivity suite, Eclipse and NetBeans interactive development environments, KDE and GNOME user interface packages, and most Linux distributions) entail millions of lines of source code. So what is going on here, and how do emerging F/OSSD processes build and sustain these different projects? How might new studies of these processes be used to explore what is new or different?

One of the more significant features of F/OSSD is the formation and enactment of complex software

†E-mail: bf@ul.ie

1 development processes performed by loosely coordinated software developers and contributors who
 2 may be globally dispersed. On some large F/OSSD
 3 projects, companies are assigning and paying software development staff to work on F/OSSD projects
 4 as part of their job. In contrast, many other developers volunteer their time and skill to such effort, and
 5 may only work at their personal discretion rather than as assigned and scheduled. Further, these
 6 developers generally provide their own computing resources, and bring their own software development tools with them. However, most F/OSS developers work on software projects that do not typically
 7 have a corporate owner or management staff to organize, direct, monitor, and improve the software development processes being put into practice. But
 8 how are successful F/OSSD projects and processes possible without regularly employed and scheduled software development staff, or without an explicit regime for software engineering project management? Why will software developers participate in
 9 F/OSSD projects? Why and how are large F/OSSD projects sustained? How are large F/OSSD projects coordinated, controlled or managed without a traditional project management team? What is it about the communications, roles, and artifacts that enable
 10 some projects to persist but not others? Why and how might these answers to these questions change over time? These are the kinds of questions raised in this article, and in the articles that follow in this Special Issue of *Software Process – Improvement and Practice*.

11 The remainder of this article is organized as follows. The next section provides further background on what F/OSSD is and what is already known about F/OSSD practices, based on both trade studies and systematic empirical studies. This survey focuses attention on identifying opportunities and challenges in understanding F/OSSD processes through empirical studies. Following this are brief overviews of each of the five articles that were selected for this Special Issue after a comprehensive submission, review, and selection effort. A final discussion then argues why the software process research community may itself want to adopt F/OSSD practices for sharing and enabling others to modify and share explicit descriptions, representations, models, and related ‘software process source code’ within and across the software, information systems, computer science, and social science research communities.

1.1. What is Free/Open Source Software Development? 52

53
 54
 55 Free (as in freedom) software and open source software (OSS) are often labeled or treated as the same thing. However, there are important differences between them with regards to the licenses assigned to the respective software, and to the beliefs/ideology of their practitioners of how and why software should be developed for sharing, modification, reuse, and redistribution. Free software generally appears licensed with the GNU general public license (GPL), while OSS may use either the GPL or some other license that allows for the integration of software that may not be free software. Free software is a social movement (Elliott and Scacchi 2004), whereas open source software development (OSSD) is a software development methodology, according to free software advocates like Richard Stallman and the Free Software Foundation (Gay 2002). However, free software is always available as OSS, but OSS is not always free software¹. This is why it is often appropriate to refer to F/OSS or FLOSS (L for *Libre*, where the alternative term of ‘libre software’ has popularity in some parts of the world) in order to accommodate similar and often indistinguishable approaches to software development. Subsequently, for the purposes of this article, focus is directed at F/OSSD processes, rather than to software licenses and social movements associated with free or OSS, though each may impinge on F/OSSD processes.

56 F/OSSD is mostly not about SE, at least not as SE is portrayed in modern SE textbooks. Similarly, F/OSSD is not SE done poorly. Instead, F/OSSD is a different, somewhat orthogonal approach to the development of software systems where much of the development activity is openly visible, development artifacts are publicly available over the Web, and generally there is no formal project management regime, budget or schedule. F/OSSD is oriented towards the joint development of a community of developers and users concomitant with the software system of interest.

57 F/OSS developers have typically been end-users of the F/OSS they develop, although this

¹ Thus, at times it may be appropriate to distinguish conditions or events that are generally associated or specific to either free software development or OSSD, but not both.

1 appears to be changing somewhat. Similarly, many
2 end-users often participate in and contribute to
3 F/OSSD efforts by providing feedback, bug reports,
4 and usability concerns. There is also widespread
5 recognition that F/OSSD projects can produce high
6 quality and sustainable software systems that can be
7 used by thousands to millions of end-users (Mockus
8 *et al.* 2002).

9 Subsequently, it is reasonable to assume that
10 F/OSSD processes are not necessarily of the same
11 type, kind, or form found in SE projects that follow
12 the processes described in modern SE textbooks.
13 While such approaches might be used within an
14 SE project, there is no basis found in the principles
15 of SE laid out in textbooks that would suggest SE
16 projects typically adopt or should practice F/OSSD
17 methods. Subsequently, what is known about SE
18 processes, a development organization's process
19 capability, and how to improve its development
20 processes may not be equally applicable to F/OSSD
21 processes, without some explicit rationale or empir-
22 ical justification. Thus, it is appropriate to review
23 some of what is known so far about F/OSSD.

26 2. RESULTS FROM RECENT STUDIES OF 27 F/OSSD

28
29 There are studies that offer some insight or find-
30 ings on F/OSSD practices where each, in turn,
31 reflects on different kinds of processes that are
32 not well understood at this time. These are sys-
33 tematic empirical studies of F/OSSD projects using
34 small/large research samples and analytical meth-
35 ods drawn from different academic disciplines. Both
36 kinds of studies stand in contrast to the popu-
37 lar examination of F/OSSD practices offered by
38 F/OSS advocates (e.g. DiBona *et al.* 1999, Pavelicek
39 2000, Raymond 2001). These popular treatments
40 tend to be grounded in personal experiences of
41 the authors, rather than through careful system-
42 atic study, though such experiences are valuable
43 because they are often a source of insight or ques-
44 tions for further inquiry.

45 A number of Web-based repositories of research
46 articles that report on studies on F/OSSD projects
47 have begun to appear. Among them are those at MIT
48 (opensource.mit.edu) with over 200 articles con-
49 tributed, and at University College Cork in Ireland
50 (opensource.ucc.ie), which features links or cita-
51 tions to multiple special issue journals focusing on

F/OSSD (e.g. *Information Systems Journal*, 11(4) and 52
12(1), 2001–2002, *IEE Proceedings – Software*, 149(1), 53
2002, *Research Policy*, 32(7), 2003, and *IEEE Software*, 54
21(1), 2004), and to proceedings from international 55
workshops of OSS research (e.g. 1st through 5th 56
Workshops on Open Source Software Engineering, 57
held in conjunction with the International Confer- 58
ences on Software Engineering, 2001–2005). Rather 59
than attempt to survey the complete universe of 60
studies in these collections, since the majority of 61
these studies do not address software processes, the 62
choice instead is to examine a set of studies² that 63
raise interesting issues or challenging problems for 64
software process research and practice. 65

66 One important qualifier to recognize is that the 66
studies below examined carefully selected F/OSSD 67
projects, or a sample of projects, so the results 68
presented should not be assumed to apply to all 69
F/OSSD projects, or to projects that have not been 70
studied. Furthermore, it is important to recognize 71
that F/OSSD is no silver bullet that resolves 72
the software crisis. Instead it is fair to recognize 73
that most of the nearly 100 000 F/OSSD projects 74
associated with Web portals like SourceForce.org 75
have very small teams of two or less developers 76
(Madey *et al.* 2004), and most projects are inactive 77
or have yet to release any operational software. 78
However, there are now at least a few thousand 79
F/OSSD projects that are viable and ongoing, 80
so that there is a sufficient universe of diverse 81
F/OSSD projects to investigate, understand, as 82
well as to model and simulate their software 83
processes. Consequently, consider the research 84
findings reported or studies cited below as starting 85
points for further investigation, rather than as 86
defining characteristics of most or all F/OSSD 87
projects or processes. 88

90 2.1. Comparing F/OSSD and SE Processes 91

92 The first category of related studies seek to iden- 92
tify and compare software development processes 93
found in F/OSSD projects with those described 94
or prescribed for SE projects, rather than just the 95
resulting software products (Paulson *et al.* 2004). 96
Mockus *et al.* (2002), in one of the most cited 97
98

99
100 ² The articles included here address some software development 100
process, such as the OSS design process, in the body of their 101
article (as found using search engines), or address topics that 101
heretofore have not appeared in prior software process studies. 102

1 studies of F/OSSD, briefly describe the processes
2 accounting for the development of the Apache Web
3 Server and the Mozilla Web Browser. However,
4 such an account does not provide sufficient content
5 to directly compare them to traditional SE pro-
6 cesses. In contrast, Reis and Fortes (2002) provide
7 one of the first in-depth examinations of the over-
8 all process accounting for the development of the
9 Mozilla Web Browser. They identify different devel-
10 oper roles, tools being used, artifacts created, and
11 activities performed, which potentially provides
12 adequate information for modeling and comparing
13 the process.

14 Scacchi (2002) provides a narrative description
15 of the software requirements process found in a
16 sample of F/OSSD projects and compares it to
17 the requirements engineering process portrayed
18 in modern SE textbooks. The F/OSSD projects
19 examined span applications in application domains
20 including Internet infrastructure, networked com-
21 puter games, astrophysics, and academic software
22 design research. In a related study (Scacchi 2004),
23 he identifies differences in software processes for
24 requirements and design, configuration manage-
25 ment, evolution, project management, and soft-
26 ware technology transfer from those in SE texts
27 as found in the comparative study of multiple
28 F/OSSD projects of a common type and networked
29 computer games. Further, in two additional stud-
30 ies, he examines data and models accounting for
31 software evolution (Lehman 2002) compared to
32 those emerging for F/OSSD (Scacchi 2005a), and
33 also emerging sociotechnical processes found in
34 F/OSSD projects that intermingle social (e.g. team,
35 group, and individual) and technical development
36 processes (Scacchi 2005b, Truex *et al.* 1999). All of
37 these studies describe processes found in different
38 F/OSSD projects using narrative descriptions or
39 models. Furthermore, recent work describes how
40 these processes have been modeled and simulated
41 in a variety of notational, computational, and ethno-
42 graphic schemes (Scacchi *et al.* 2005c).

44 Finally, other recent efforts to model and simu-
45 late F/OSSD processes of different kinds has begun
46 to appear. Antoniadis *et al.* (2004) and Smith *et al.*
47 (2004) both provide simulation models of processes
48 accounting for the overall development or evolution
49 of multiple F/OSSD projects. Both efforts rely on
50 models expressed as continuous functions through
51 either algebraic formulae or systems of equations.

Such an approach to process simulation and mod- 52
eling appears well matched to Systems Dynamics- 53
based process simulation tools. In contrast, Jensen 54
and Scacchi (2004, 2005) model and reenact pro- 55
cesses found in a small sample of OSSD projects 56
using language-based process models and a pro- 57
cess reenactment simulator following techniques 58
developed for analyzing traditional SE processes 59
(Noll and Scacchi 2001, Scacchi 1999). The ability 60
to reenact F/OSSD processes provides an approach 61
for how to independently examine and validate 62
whether the captured process reflects the observed 63
practice, as well as makes the modeled processes 64
available for reuse, tailoring, improvement, or prac- 65
tice in other F/OSSD projects. 66

2.2. Motivating, Joining, Participating, and Contributing to F/OSSD Projects

One of the most common questions about F/OSSD
projects is why software developers will join and
participate in such efforts, often without pay for
sustained periods of time. Accordingly, we might
then ask whether or how the participation of
developers affects what gets done in a F/OSSD
project in terms of which processes are engaged, as
well as understanding how processes for recruiting
and integrating new developers into F/OSSD
projects operate. A number of surveys of F/OSS
developers (Ghosh and Prakash 2000, Hars and Ou
2002, Hann *et al.* 2002, Lakhani *et al.* 2002, Hertel
et al. 2003) have begun to pose such questions, and
the findings reveal the following.

First, F/OSS developers generally find the great-
est benefit from participation is the opportunity to
learn and to share what they know about software
system functionality, design, methods, tools, and
practices associated with specific projects or com-
munity leaders (Lakhani *et al.* 2002). F/OSSD is a
venue for learning for individuals, project groups,
and organizations, and learning organizations are
ones which can continuously improve or adapt their
processes and practices (Nakakoji *et al.* 2002, Hunt-
ley 2003, Ye and Kishida 2003). However, though
much of the development work in F/OSSD projects
is unpaid or volunteer, individual F/OSS develop-
ers often benefit with higher average wages and
better employment opportunities (at present), com-
pared to their peers who lack F/OSSD experience
or skill (Hann *et al.* 2002, Lerner and Tirole 2002).

1 Second, F/OSS developers appear to really enjoy
2 their F/OSSD work (Hertel *et al.* 2003), and to be rec-
3 ognized as trustworthy and reputable contributors
4 (Stewart and Gosain 2001). F/OSS developers also
5 self-select the technical roles they will take on as part
6 of their participation in a project (Ye and Kishida
7 2003, Gacek and Arief 2004), rather than be assigned
8 to a role in a traditionally managed SE project, where
9 the assigned role may not be to their liking.

10 Third, many F/OSS developers participate in and
11 contribute to multiple F/OSSD projects. In one
12 study, 5% of developers surveyed reported partic-
13 ipating in 10 or more F/OSSD projects (Hars and
14 Ou 2002). However, a small group of core devel-
15 opers who control the architecture and direction
16 of development typically develop the vast major-
17 ity of F/OSS released by a project. Subsequently,
18 most participants typically contribute to just a single
19 module, though a small minority of modules may
20 include patches or modifications contributed by
21 hundreds of contributors (Ghosh and Prakash 2000).

22 Consequently, how and why software developers
23 will join, participate in, and contribute to an
24 F/OSSD project seems to represent a new kind
25 of process affecting how F/OSS is developed
26 and maintained (von Krogh *et al.* 2003, Scacchi
27 2005b). Subsequently, modeling and simulating
28 what this process is, how it operates, and how it
29 affects software development is an open research
30 challenge.

31

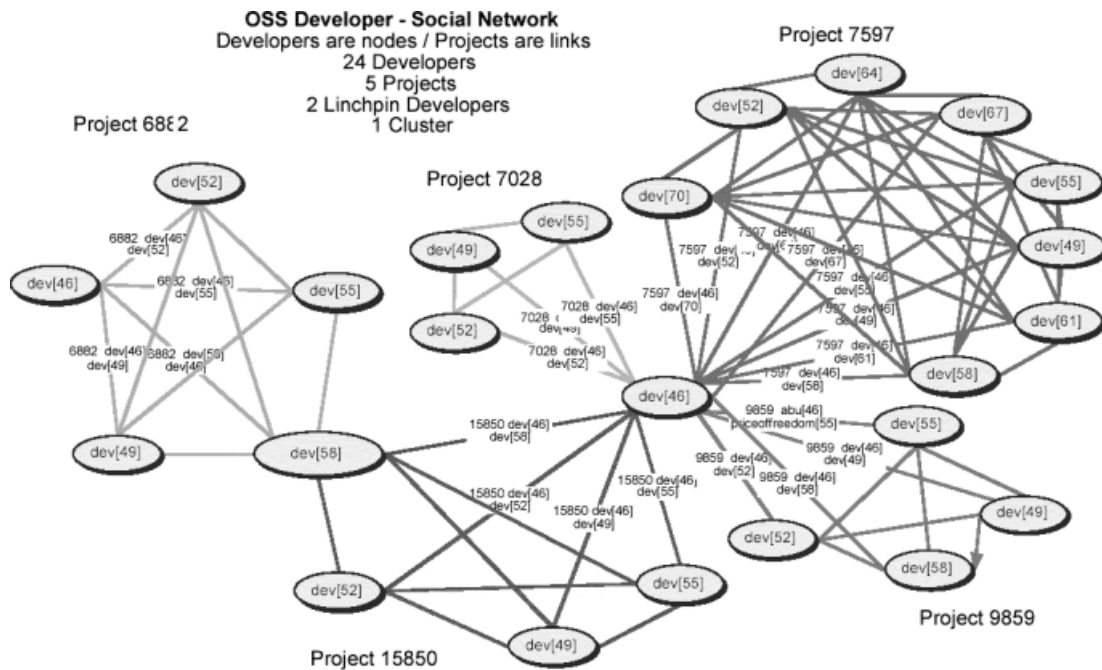

32 **2.3. Alliance Formation, Social Networking,** 33 **Community Development, and Software** 34 **Development** 35

36 How does the gathering of individual F/OSS devel-
37 opers give rise to a more persistent project team or
38 self-sustaining community? Through choices that
39 developers make for their participation and con-
40 tribution to an F/OSSD project, they find that
41 there are like-minded individuals who also choose
42 to participate and contribute to a project. These
43 software developers find and connect with each
44 other through F/OSSD Web sites and online dis-
45 course (e.g. threaded e-mail discussions) (Monge
46 *et al.* 1998), and they find they share many tech-
47 nical competencies, values, and beliefs in common
48 (Crowston and Scozzi 2002, Espinosa *et al.* 2002,
49 Elliott and Scacchi 2004). This manifests itself in the
50 emergence of an occupational network of F/OSS
51 developers (Elliott and Scacchi 2003).

52 Becoming a central node in a social network
53 of software developers that interconnects multiple
54 F/OSS projects is also a way to accumulate social
55 capital and recognition from peers. However, it
56 also enables the merger of independent F/OSS
57 systems into larger composite ones that gain
58 the critical mass of core developers to grow
59 more substantially and attract ever larger user-
60 developer communities (Madey *et al.* 2004, Scacchi
61 2005b). 'Linchpin developers' (Madey *et al.* 2004)
62 participate in or span multiple F/OSSD projects. In
63 so doing, they create alliances between otherwise
64 independent F/OSSD projects (Hars and Ou 2002).
65 Figure 1 depicts an example of a social network of
66 24 F/OSS developers within 5 F/OSS projects that
67 are interconnected through two linchpin developers
68 (Madey *et al.* 2004). Such interconnection enables
69 small F/OSS projects to come together as a larger
70 social network with the critical mass (Marwell and
71 Oliver 1993) needed for their independent systems
72 to be merged and collectively experience more
73 growth in size, functionality, and user base. F/OSSD
74 Web sites also serve as hubs that centralize attention
75 on what is happening with the development of
76 the focal F/OSS system, its status, participants
77 and contributors, discourse on pending/future
78 needs, etc.

79 Thus interesting problems arise when investigat-
80 ing how best to capture or represent the processes
81 of alliance formation and interproject social net-
82 working, and how such processes can be shown to
83 facilitate or constrain F/OSSD activities, tool usage,
84 and preference for which development artifacts are
85 most valued by project participants.

86 Developing F/OSS systems is a community
87 and project team building process that must be
88 institutionalized within a community (Sharma *et al.*
89 2002, Smith and Kollock 1999, Preece 2000, Ye
90 *et al.* 2004) for its software informalisms (artifacts)
91 and tools to flourish. Downloading, installing,
92 and using F/OSS systems acquired from other
93 F/OSS Web sites is also part of a community
94 building process (Kim 2000). Adoption and use
95 of F/OSSD project Web sites is a community-
96 wide practice of how to publicize and share
97 F/OSS project assets. These Web sites can be
98 built using F/OSSD Web site content management
99 systems (e.g. PHP-Nuke) to host project contents
100 that can be served using F/OSS Web servers
101 (Apache), database systems (MySQL) or application
102 servers (JBoss), and increasingly accessed via F/OSS

Color Figure - Online only

AQ2

Figure 1. A social network that links 24 developers in five projects through two key developers into a larger F/OSS project community• (Madey *et al.* 2004)

1 Web browsers (Mozilla and Firefox). Furthermore,
 2 ongoing F/OSSD projects may employ dozens of
 3 F/OSS development tools, whether as standalone
 4 systems like the software version control system
 5 CVS, as integrated development environments like
 6 NetBeans or Eclipse, or as subsystem components of
 7 their own F/OSS application in development. These
 8 projects similarly employ asynchronous systems
 9 for project communications that are persistent,
 10 searchable, traceable, public, and globally accessible
 11 (Yamauchi *et al.* 2000).

12 F/OSS systems, hyperlinked artifacts and tools,
 13 and project Web sites serve as venues for socializ-
 14 ing, building relationships and trust, sharing and
 15 learning with others. Community building, alliance
 16 forming, and participatory contributing are essen-
 17 tial and recurring activities that enable F/OSSD
 18 projects to persist without central corporate author-
 19 ity. Linking people, systems, and projects together
 20 through shared artifacts and sustained online dis-
 21 course enables a sustained sociotechnical commu-
 22 nity, information infrastructure (Jensen and Scacchi
 23 2005), and a network of alliances (Monge *et al.* 1998)
 24 to emerge.

25 For this reason, problems arise when investigat-
 26 ing how best to capture and represent the F/OSSD

processes that facilitate and constrain the codevel- 27
 opment and coevolution of F/OSS project commu- 28
 nities and the software systems they produce. The 29
 point is not to separate the development and evolu- 30
 tion processes of the software system from its 31
 community, since each is codependent on the other, 32
 and the success of one depends on the success of the 33
 other. Thus, they must be captured, understood, 34
 modeled, and simulated/reenacted as integrating 35
 and intertwining processes. 36

37
 38
 39
 40
2.4. Software Evolution in a Multiproject Software Ecosystem

41 As noted above, many F/OSSD projects have
 42 become interdependent through the networking
 43 of software developers, development artifacts,
 44 common tools, shared Web sites, and computer-
 45 mediated communications. What emerges from this
 46 is a kind of multiproject software ecosystem (High-
 47 smith 2002), whereby ongoing development and
 48 evolution of one F/OSS system gives rise to prop-
 49 agated effects, changes, or vulnerabilities in one or
 50 more of the projects linked to it (Jensen and Scacchi
 51 2005). These interdependencies are most apparent
 52 when F/OSSD projects share source code modules

1 or components. In such situations, the volume of
2 source code of an individual F/OSSD project may
3 appear to grow at a superlinear or exponential rate
4 (Scacchi 2005a, Schach *et al.* 2002, Smith *et al.* 2004).
5 Such an outcome, which economists and political
6 scientists refer to as a 'network externality' (Ostrom
7 *et al.* 1990), may be due to the import or integra-
8 tion of shared components, or the replication and
9 tailoring of device, platform, or internationalization
10 specific code modules. Such system growth pat-
11 terns might challenge the well-established laws of
12 software evolution (Lehman 1980, 2002). Thus, soft-
13 ware evolution in a multiproject F/OSS ecosystem
14 is a process of coevolution of interrelated and inter-
15 dependent F/OSSD projects, people, artifacts, tools,
16 code, and project-specific processes.
17 Software evolution in a multiproject F/OSS
18 ecosystem also suggests attending to social or tech-
19 nological mechanisms that provide some form of
20 'natural selection'. In biological ecosystems, natural
21 selection provides an account of why some species
22 flourish and adapt in response to environmental
23 pressures, such as shortage of food sources or the
24 rise of new predators, while other species that do not
25 adapt progressively disappear or become extinct.
26 In F/OSS ecosystems, a diversity of software sys-
27 tem variants often appear as distinct projects. For
28 example, there are a number of F/OSS operating
29 systems with projects based on variants of the Unix
30 operating system – Linux, FreeBSD, OpenBSD, Dar-
31 win, GNU Hurd, etc.–and each of these may have
32 multiple subvariants (or forked distributions) like
33 Debian GNU/Linux, SUSE Linux, Red Hat Linux,
34 and hundreds of others. Web browsers, software
35 build/make tools, database management systems,
36 file management utilities, content management sys-
37 tems, and other types of software systems can
38 be found by the dozens, perhaps reflecting their
39 development in different F/OSS ecosystem niches.
40 Similarly, one can readily find at F/OSS project por-
41 tals like SourceForge.net, Freshmeat.net or Savan-
42 nah.gnu.org, multiple projects developing the same
43 type of software system, but with variations in soft-
44 ware architecture, choice of functional components,
45 choice of programming language, and project con-
46 tributors. However, in some software domains, a
47 dominant software system and project has emerged
48 to effectively displace alternative variants by a large
49 majority, like the Apache Web server, though such
50 dominance has not completely eliminated the con-
51 tending alternative F/OSS project efforts. As such,

accounting for such evolutionary adaptation in 52
response to emerging technological opportunities 53
(new tools) or limited access to more established 54
F/OSS projects or core developers is thus a chal- 55
lenge for those seeking to understand the processes 56
of software evolution across a software ecosystem 57
(Lehman 2002, Nakakoji *et al.* 2002, Smith *et al.* 2004, 58
Ye *et al.* 2004). 59

Last, it seems reasonable to observe that the world 60
of F/OSSD is not the only place where multi- 61
project software ecosystems emerge, as software 62
sharing or reuse within traditional software devel- 63
opment enterprises is common (Highsmith 2002, 64
Jensen and Scacchi 2005). However, the process 65
of the coevolution of software ecosystems found 66
in either traditional or F/OSSD projects in mostly 67
unknown. Thus, software coevolution within an 68
F/OSS ecosystem represents an opportunity for 69
research that investigates understanding such a 70
software evolution process through studies sup- 71
ported by techniques for modeling and simulating 72
coevolving processes. 73

Overall, the sample of F/OSSD research studies 74
and findings presented above reveals a number of 75
interesting challenges for research in understanding 76
F/OSSD processes. However, these studies are all 77
grounded in an empirical basis where different 78
types of processes are being examined in different 79
types of F/OSSD projects of varying sample size and 80
data collection methodology. So the fundamental 81
problem at hand is how to organize, reframe, and 82
make clear what the challenges are in researching, 83
improving, and practicing F/OSSD processes. The 84
articles in this special issue help provide new 85
insights and findings for better understanding the 86
problem and challenges. 87

3. ARTICLES SELECTED FOR THE SPECIAL 90 ISSUE 91

Five articles were selected as a result of the 93
submission and review process from a pool of 21 94
submitted articles for inclusion in this Special Issue. 95
In our first article, 'Evaluation of Free/Open Source 96
Software Products through Project Analysis,' David 97
Cruz, Thomas Wieland, and Alexander Ziegler 98
introduce a systematic approach for supporting 99
a decision to incorporate F/OSS products into a 100
larger context, such as a software or enterprise-wide 101
system. The process of evaluating and integrating 102

AQ3

1 commercially available off-the-shelf software (often
2 referred to as COTS software) has been written
3 and described at length in academic and industrial
4 literature. Often, such evaluations are conducted to
5 avoid unnecessary risks, including the technical
6 (Hissam and Plakosh 1999) and mission needs
7 of the system to which the evaluated software
8 is to be incorporated (Carney *et al.* 2003). Often,
9 many of the same considerations apply to F/OSS
10 products. However, as this article points out, there
11 are additional and relevant aspects of an F/OSS
12 project that produces the F/OSS product that should
13 be taken into consideration. The authors nicely
14 characterize these considerations into functional,
15 technical, organizational, legal, economical and
16 political aspects and thereby provide a broader
17 perspective on F/OSS products when performing
18 such evaluations.

19 In 'Information Systems Success in Free and
20 Open Source Software Development: Theory and
21 Measures', Kevin Crowston, Hala Annabi, James
22 Howison, and Chengetai Masango address a key
23 gap in FLOSS research by seeking to define what
24 'success' means in a FLOSS context. They derived
25 a range of potential measures from the Information
26 Systems (IS) literature, including system and infor-
27 mation quality, user satisfaction, user experience,
28 individual and organizational impacts, and then
29 added a number of additional measures specific to
30 the dynamics of the FLOSS development process.
31 The list of measures was then refined, operational-
32 ized, and validated through empirical studies based
33 in the SlashDot and SourceForge communities. The
34 article makes a welcome contribution by provid-
35 ing a solid instrument for the future evaluation of
36 FLOSS processes, and one that will mature and
37 increase in its utility with further use.

38 David Nichols and Michael Twidale report on
39 their study of 'Usability Processes in Open Source
40 Software.' They describe mechanisms, techniques,
41 and technology used in F/OSS projects like Mozilla
42 and GNOME. Both of these projects develop sys-
43 tems that include substantial user interface compo-
44 nents and functionality, and so they are primary
45 candidates to consider how F/OSS development
46 processes and practices embrace or ignore usabil-
47 ity concerns. They use examples drawn from bug
48 reporting and discussion systems to highlight both
49 the current practice, and how it might be revised
50 to realize higher quality F/OSS development out-
51 comes and easier to use application systems. This

52 in turn may give rise to recognizing how F/OSS
53 projects need to both address their ease of develop-
54 ment (or 'developability') and the usability of the
55 resulting software systems. This is particularly true,
56 as Nichols and Twidale observe, when developers
57 and users are geographically dispersed, have lim-
58 ited resources to affect current processes, and may
59 lack easily accessible sources of expertise about the
60 functionality of the systems being developed, as
61 well as how to make such functionality easy to use.

62 Douglas Schmidt and colleagues at Vanderbilt
63 University and University of Maryland at College
64 Park investigate 'Techniques and Processes for
65 Improving the Quality and Performance of Open
66 Source Software.' Their research complements the
67 work of Crowston *et al.* in this issue, but whereas
68 that article sought to define success, Schmidt
69 *et al.* tackle the more specific question of software
70 quality. They describe some of the challenges
71 associated with FLOSS, and explore the ways in
72 which quality assurance (QA) processes that are
73 specifically designed for FLOSS processes can help
74 address these challenges. They support their work
75 with empirical examinations of FLOSS projects
76 using these QA processes, and conclude with
77 extremely practical findings of direct benefit to
78 FLOSS practitioners.

79 Katherine Stewart and Sanjay Gosain exam-
80 ine 'The Moderating Role of Development Stage
81 in Affecting Free/Open Source Software Project
82 Performance.' This is an important contribution
83 towards understanding how social factors like team
84 trust and ideology interact with the development
85 process of a project and impact objective and sub-
86 jective outcomes like task completion, number of
87 developers mobilized, and perceived effectiveness.
88 Using data from 67 F/OSS communities, they show
89 that the dynamics of performance change as a
90 project moves through various development stages.
91 Their results suggest that objective measures of
92 project performance tend to improve over time and
93 with increases in development stage, while subjec-
94 tive assessments depend to a greater extent on the
95 project administrators' experience. For example, the
96 importance of trust in teams varies on the basis of
97 the development stage of the project and the per-
98 formance criteria. Overall they have presented a
99 sophisticated view of the interaction between the
100 social and technical factors in a F/OSSD project
101 throughout its development process. 102

1 4. DISCUSSION

2 F/OSSD projects represent and offer new publicly
3 available data sources of a size, diversity, and com-
4 plexity not previously available for research, on a
5 global basis. Software process research and appli-
6 cation has traditionally relied on an empirical basis
7 in real-world processes for analysis, validation, or
8 improvement. However, such data has often been
9 scarce, costly to acquire, and is often not available
10 for sharing or independent reanalysis for reasons
11 including confidentiality or nondisclosure agree-
12 ments. In contrast, F/OSSD projects and project
13 repositories contain process data and product arti-
14 facts that can be collected, analyzed, shared, and
15 reanalyzed in a free and open source manner.
16 The articles in this Special Issue draw upon pub-
17 licly available data and artifacts in their analyses.
18 F/OSSD therefore poses the opportunity to favor-
19 ably alter the costs and constraints of accessing,
20 analyzing, and sharing software process and prod-
21 uct data, metrics, and data collection instruments.
22 F/OSSD is thus poised to alter the calculus of empir-
23 ical SE, information systems, and perhaps even
24 computer science, while software process research
25 is an arena that can take advantage of such a histor-
26 ically new opportunity.

27 Finally, one important dimension that has not yet
28 been addressed in this article is whether and how
29 the software process research community might
30 adopt F/OSSD practices themselves. For exam-
31 ple, one traditional barrier to engaging students
32 in software process studies is the paucity of free
33 or low-cost modeling and simulation tools. Shar-
34 ing one's software process models and simulations
35 with colleagues is difficult at present, if they must
36 buy new and unfamiliar tools. The ability to reuse,
37 reanalyze, or extend a colleague's models or simu-
38 lations is similarly limited. The community needs and
39 should directly benefit from F/OSS process models,
40 tools, and process data/model repositories that can
41 be easily acquired or shared, studied, modified, and
42 redistributed to the mutual benefit of all. Similarly,
43 it can also be noted that it further serves the collec-
44 tive interest of the community to consider how to
45 develop a globally shared and interoperable infor-
46 mation infrastructure for data sharing, modeling,
47 and simulating software processes³. This is true,
48

49 ³ Efforts like the FLOSSmole repository (www.flossmole.org) and
50 the SourceForge.net Research Data repository (www.nd.edu/~oss/Data/data.html) are two emerging examples in this area.

52 whether these processes are found in SE or F/OSSD
53 projects. As a consequence, these are all opportu-
54 nities for the software process research community
55 to realize and pursue. After all, we are the ones
56 who will benefit from efforts to develop such free
57 (as in freedom) and open source resources, as well
58 as further our collective learning and community
59 building efforts.

60
61
62 5. CONCLUSIONS

63 Free and OSS development is emerging as an
64 alternative approach for developing large software
65 systems. New types and new kinds of software
66 processes are emerging within F/OSSD projects,
67 as well as new characteristics for development
68 project success, when compared to those found
69 in traditional industrial software projects and those
70 portrayed in software engineering textbooks. As a
71 result, F/OSSD offers new types and new kinds of
72 processes to research, understand, improve, and
73 practice. Similarly, understanding how F/OSSD
74 processes are similar to or different from SE pro-
75 cesses is an area ripe for further research and
76 comparative study. Many new research opportu-
77 nities exist in the empirical examination, modeling,
78 simulation, improvement, and practice of F/OSSD
79 processes.

80 Through a survey of empirical studies of F/OSSD
81 projects and other analyses presented in this article,
82 it should be clear there is an exciting variety and
83 diversity of opportunities for new research aimed
84 at understanding and improving the practice of
85 F/OSSD. Thus, you are encouraged to consider
86 how your efforts to research or apply software
87 process concepts, techniques, or tools can be
88 advanced through studies that examine processes
89 found in F/OSSD projects, and that practice free
90 or open source sharing, reuse, and extension of
91 *software process* data, artifacts, models, and public
92 repositories.

93

WILEY AUTHOR DISCOUNT CARD

As a highly valued contributor to Wiley's publications, we would like to show our appreciation to you by offering a **unique 25% discount** off the published price of any of our books*.

To take advantage of this offer, all you need to do is apply for the **Wiley Author Discount Card** by completing the attached form and returning it to us at the following address:

The Database Group
John Wiley & Sons Ltd
The Atrium
Southern Gate
Chichester
West Sussex PO19 8SQ
UK

In the meantime, whenever you order books direct from us, simply quote promotional code **S001W** to take advantage of the 25% discount.

The newest and quickest way to order your books from us is via our new European website at:

<http://www.wileyeurope.com>

Key benefits to using the site and ordering online include:

- Real-time SECURE on-line ordering
- The most up-to-date search functionality to make browsing the catalogue easier
- Dedicated Author resource centre
- E-mail a friend
- Easy to use navigation
- Regular special offers
- Sign up for subject orientated e-mail alerts

So take advantage of this great offer, return your completed form today to receive your discount card.

Yours sincerely,

Verity Leaver
E-marketing and Database Manager

*TERMS AND CONDITIONS

This offer is exclusive to Wiley Authors, Editors, Contributors and Editorial Board Members in acquiring books (excluding encyclopaedias and major reference works) for their personal use. There must be no resale through any channel. The offer is subject to stock availability and cannot be applied retrospectively. This entitlement cannot be used in conjunction with any other special offer. Wiley reserves the right to amend the terms of the offer at any time.

REGISTRATION FORM FOR 25% BOOK DISCOUNT CARD

To enjoy your special discount, tell us your areas of interest and you will receive relevant catalogues or leaflets from which to select your books. Please indicate your specific subject areas below.

YOUR PERSONAL DATA

We, John Wiley & Sons Ltd, will use the information you have provided to fulfil your request. In addition, we would like to:

1. Use your information to keep you informed by post, e-mail or telephone of titles and offers of interest to you and available from us or other Wiley Group companies worldwide, and may supply your details to members of the Wiley Group for this purpose.
 Please tick the box if you do not wish to receive this information
2. Share your information with other carefully selected companies so that they may contact you by post, fax or e-mail with details of titles and offers that may be of interest to you.
 Please tick the box if you do not wish to receive this information.

If, at any time, you wish to stop receiving information, please contact the Database Group (databasegroup@wiley.co.uk) at John Wiley & Sons Ltd, The Atrium, Southern Gate, Chichester, West Sussex PO19 8SQ, UK.

E-MAIL ALERTING SERVICE

We offer an information service on our product ranges via e-mail. If you do not wish to receive information and offers from John Wiley companies worldwide via e-mail, please tick the box .

This offer is exclusive to Wiley Authors, Editors, Contributors and Editorial Board Members in acquiring books (excluding encyclopaedias and major reference works) for their personal use. There should be no resale through any channel. The offer is subject to stock availability and may not be applied retrospectively. This entitlement cannot be used in conjunction with any other special offer. Wiley reserves the right to vary the terms of the offer at any time.
